

## Delay-on energisation PZA

### Unit features

- ▶ Positive-guided relay outputs:
  - 1 safety contact (N/O), delay-on energisation
  - 2 auxiliary contacts (N/C), delay-on energisation
- ▶ LED indicator for:
  - Switch status channel 1/2
  - Supply voltage
- ▶ 12 time values, set via rotary switch

### Safety features

- The relay meets the following safety requirements:
- ▶ The circuit is redundant with built-in self-monitoring.
  - ▶ The safety function remains effective in the case of a component failure.
  - ▶ The correct opening and closing of the safety function relays is tested automatically in each on-off cycle.

### Unit description

The unit operates as a time delay device

- ▶ in accordance with prEN 1088 (release with delay through timer)
- ▶ in safety circuits in accordance with VDE 0113-1 and EN 60204-1 (e.g. on movable guards)

The unit is designed for use with

- ▶ Safety relays from the PNOZ series
- ▶ Safety gate monitors from the PST series

The category that can be achieved in accordance with EN 954-1 depends on the category of the base unit. The PZA may not exceed this.

Delay-on energisation timer for unlocking an interlock with delay

### Approvals

### Block diagram

## Delay-on energisation PZA

### Function description

The timer is ready to start once the feedback loop is closed. If the supply

voltage at the input circuit is interrupted, the safety contact will open and the auxiliary contacts will close. If the input circuit is closed, i.e. supply volt-

age is present, the safety contact will be closed with delay-on energisation and the auxiliary contacts will be opened.

### Timing diagram

### Key

- ▶ Input: Input circuit A1-A2
- ▶ Feedback: Feedback loop Y1-Y2
- ▶ Output safe: Safety contact 17-18

- ▶ Output aux: Auxiliary contacts 25-26, 35-36
- ▶  $t_v$ : Delay time
- ①: Normal operating cycle

- ②: Fault: Input circuit opened too early
- ③: Fault: Feedback loop closed too late after  $t_v$  elapsed

### Wiring

Please note:

- ▶ Information given in the “Technical details” must be followed.
- ▶ Output is a safety contact, outputs are auxiliary contacts (e.g. for display)
- ▶ To prevent contact welding, a fuse should be connected before the output contacts (see technical details).
- ▶ Calculation of the max. cabling runs  $I_{max}$  in the input circuit:

$$I_{max} = \frac{R_{lmax}}{R_l / km}$$

$R_{lmax}$  = max. overall cable resistance (see technical details)

$R_l / km$  = cable resistance/km

- ▶ Use copper wire that can withstand 60/75 °C.
- ▶ Supply voltage 24 VDC: Shorts between the input circuit and feedback loop or earth faults in the feedback loop can damage the unit.
- ▶ We recommend the use of a short circuit-proof voltage supply with current limitation

## Delay-on energisation PZA

### Preparing for Operation

► Supply voltage

AC	
Input circuit is driven by connecting $U_B$	

► Feedback loop

Feedback loop	
Contacts from external contactors	

## Delay-on energisation PZA

### Terminal configuration

### Installation

- ▶ The safety relay should be installed in a control cabinet with a protection type of at least IP54.
- ▶ Use the notch on the rear of the unit to attach it to a DIN rail.
- ▶ Ensure the unit is mounted securely on a vertical DIN rail (35 mm) by using a fixing element (e.g. retaining bracket or an end angle).

### Dimensions

## Delay-on energisation PZA

### Notice

This data sheet is only intended for use during configuration. For installation and operation, please refer to the operating instructions supplied with the unit.

### Service life graph
